

Sentinel

An AI-powered intelligence platform for modern teams.

Seed round · 2026

The problem

Online payment fraud costs companies billions every year.

Existing tools run in batch. By the time they flag a transaction, the money has already moved and the chargeback is inevitable.

Risk teams are stuck reviewing what already happened.

What we do

Sentinel scores every transaction in under 200 milliseconds, inline, before it settles.

We combine device signals, behavioural features and a low-latency model to give an accept / review / decline decision synchronously.

Capturing just **1%** of this market is a \$500M revenue business.

Team

Our founding team brings together deep, complementary expertise across payments infrastructure, machine learning systems and enterprise go-to-market motions, with a shared history of shipping mission-critical systems at scale in high-regulation environments. Our CEO spent six years at a leading payments company where they led fraud detection initiatives spanning real-time scoring, chargeback mitigation and merchant risk tooling, and worked closely with cross-functional stakeholders across risk, engineering and compliance to deliver measurable reductions in fraud loss rates. Our CTO previously architected distributed low-latency systems and brings a rigorous engineering philosophy focused on reliability, observability and operational excellence. Together the team has built and scaled systems handling significant transaction volumes and has developed a nuanced understanding of the operational, technical and organisational challenges inherent in deploying real-time decisioning infrastructure inside large financial institutions and high-growth fintech companies.
